AB Elastomer masterbatch is processed in a continuous compounder having multiple parallel elongate rotors axially oriented in an elongate processing chamber. Optionally, addnl. materials are compounded into the masterbatch, e.g., additives, other elastomeric compns., etc. Preferably, the masterbatch then is further processed in an open mill. Excellent control of Mooney Viscosity is achieved. In certain preferred embodiments, elastomer composites are produced by novel continuous flow methods and app. in which fluid streams of particulate filler and elastomer latex are fed to the mixing zone of a coagulum reactor to form a coagulated mixt. in semi-confined flow continuously from the mixing zone through a coagulum zone to a discharge end of the reactor. The particulate filler fluid is fed under high pressure to the mixing zone, such as to form a jet stream to entrain elastomer latex fluid sufficiently energetically to substantially completely coagulate the elastomer with the particulate filler prior to the discharge end without need of adding acid or salt soln. or other coagulation step. The coagulated elastomer and particulate filler composite is fed into the aforesaid continuous compounder for processing and control of its moisture level and Mooney Viscosity. Novel elastomer composites are produced. Such novel elastomer composites combine material properties and characteristics, such as choice of filler, elastomer, level of filler loading, moisture level, Mooney Viscosity, balance between mol. wt. and amt. of bound rubber, and macro-dispersion not previously achieved.

AB	A core-shell polymer, esp. useful as an impact modifier for styrene polymers, is prep'd. which contains a rubbery core of crosslinked, conjugated diolefin polymer or copolymer with 0-50% vinyl monomer and .gtoreq.1 shell of a vinylarene polymer or copolymer, has av. particle diam. .ltoreq.250 nm, and has toluene swell index 13-45. Thus, particles having a core of butadiene-styrene copolymer and a shell of polystyrene were prep'd. and used (20%) as a modifier in Styron 489, giving a compn. having Izod notched impact strength 438 J/m.

AB	Non-ABS polymer compns. for housings for power tools for gardening comprise particulate (particle size 50-500 nm) emulsion graft polymer (glass temp. <0.degree.) 25-50, amorphous or partially cryst. copolymer 50-75, polycarbonate 0-50, and particulate or fibrous filler 0-50%. The blends are more resistant to weathering than ABS, HIPS, or polyolefin resins. In an example, a Bu acrylate-tricyclodecenyl acrylate copolymer was prep'd. and grafted with acrylonitrile and styrene and this graft polymer was blended with acrylonitrile-styrene copolymer to provide a molding compn.
